

Flood detector

Código: LD-81

The detector indicates room water floods (e.g. cellars, bathrooms). This information is sent to an alarm system for alert message transmission. It is connectible to an JABLOTRON 100+ alarm system via a JA-150M wireless detector.

Descripción del producto:

If the detector is triggered (e.g. by a water), it sends a trigger signal. If the detector goes into a stand-by condition, it sends a non-triggered signal. The LD-81 takes its power supply from the JA-150M's circuit.

Información técnica:

Operating environment	II. internal
------------------------------	--------------

Operational temperature range	-10 to +40 °C
--------------------------------------	---------------

Alarm condition	water flood
------------------------	-------------

Maximum length of the cable	2.5 m (can't be extended)
------------------------------------	---------------------------

Complies with	EN 50130-4, EN 55022
----------------------	----------------------
